

Device against Legionella bacteria

Openness above all brings success on new ways

From
Roman
Haeusgen

To have no more legionella bacteria in the showering line, it is a aim high. In the entrusted child care it cannot be faithful enough. So just the water in the line has to be harmless and must not contain bacteria, who can cause the dangerous legionnaires' disease. It is obvious, that the city and school administration are worry about a recurrent emergent legionella problem.

In the building administration of Hettstedt in this connexion even new paths are committed. The attempt is worth, they

think to oneself, if two flies with a flap can be struck: Hygienically harmless water without complex tubing reorganization, as it was already made in a school in Sangerhaus and which was envisaged in the day-care centre of Wippra.

Surely in other authorities they will have a agog look to the "rainbow", how the circulation valve will prove oneself. Because legionella bacteria are now times no exotic rarity. Particularly once again the benefit is shown again here, when a thing is handled forthright and without secret ado. Maybe, someday the people of Hettstedt not only get thanks for their doing in testing a novel successful thing but also that they spoke in all public about it.
